

FROM RAW DATA TO EXECUTIVE INSIGHT

E-commerce dashboard case study

How I used Power BI to turn transactional data into a clear, self-service view for non-technical executive stakeholders.

PERSONAL PROJECT

END-TO-END OWNERSHIP

Microsoft Power BI • Power Query • DAX • Data modelling

A single-page executive view designed to answer the most important performance questions in seconds.

The brief: turn a raw CSV into an executive decision tool

The challenge was not simply to visualise data—it was to make performance understandable without requiring technical analysis.

BUSINESS QUESTIONS

- 01

What is driving sales?
Identify the products, categories, geographies and segments contributing most to revenue.
- 02

How are sales and profit changing?
Show year-over-year performance and monthly trends with immediate context.
- 03

Where should leaders focus?
Surface the strongest products, categories and customer segments without digging through raw rows.

SOURCE DATA	Raw e-commerce CSV Transactional records spanning sales, profit, products, segments, geography and dates.
AUDIENCE	Executive stakeholders Users needed fast answers and context—not a technical data model or dense table.
MY ROLE	End-to-end analytics & design Extraction, cleaning, modelling, DAX, visual design, interaction and final dashboard UX.

Objective: create one intuitive view that answers the most important performance questions at a glance.

I kept the complexity behind the dashboard

The analytical work was substantial; the stakeholder experience was deliberately simple.

Design principle: complexity stays behind the dashboard; decisions stay in front.

The page is structured around how executives scan information

Information hierarchy, context and interaction were designed for fast comprehension.

01 Headline KPIs first

Sales, profit, profit margin and units sold sit at the top of the visual hierarchy.

02 Context beside the number

Prior-year values and growth rates prevent headline figures from being interpreted in isolation.

03 Drivers below outcomes

Trend, category, product and segment views explain what is behind the top-line result.

04 Self-service exploration

Filters let users move from overview to specific locations, segments, products and years.

A non-technical user can understand the headline, the trend and the drivers without touching the underlying data.

Every visual answers a specific business question

The chart type is secondary; the question it resolves is the design anchor.

How is performance changing?

Sales & profit by year

Where are the strongest months?

Monthly sales vs. average

Which products lead sales?

Top-selling products

Which categories create value?

Sales & profit by category

How do customer segments compare?

Sales mix by segment

What is driving the result?

Geography → category → sub-category

This keeps the dashboard focused on decisions rather than on showcasing technical complexity.

What this work demonstrates

A complete analytics workflow—from raw data to a polished product for a wider audience.

“

My role was not only to calculate the right numbers, but to decide what the audience needed to see, in what order, and with enough context to act on it.

The result is a self-service executive view that makes performance, trends and business drivers accessible without requiring the user to work with the raw data.

Shared publicly on LinkedIn and received strong engagement.

TECHNICAL FOUNDATION

Power Query • data modelling • DAX

Built a reliable analytical foundation before designing the interface.

DATA STORYTELLING

Prioritise • compare • explain

Used hierarchy and context to make the main story immediately visible.

STAKEHOLDER EXPERIENCE

Interactive • intuitive • one page

Created an experience a non-technical stakeholder could navigate independently.
